

# Plains Environmental

We are an environmental disposal company specializing in cavern disposal of oilfield and industrial waste. Operating out of Melville, Saskatchewan, our innovative and environmentally friendly facility can ensure the safe and efficient processing of your waste in either liquid or solid form. Our Melville facility utilizes underground caverns that were originally designed for high pressure gas storage. The resulting caverns offer superior impermeability, safety in durability, and an environmental integrity which is unmatched.

Originally designed to store high pressure gas (natural gas storage) securely at pressures up to 3000 psi, our world-class facility utilizes these sealed underground caverns along with the most demanding environmental standards to ensure the integrity of our operation. Combined with this, is the sealed holding of the wastes and the eventual hydrocarbon recovery, leaving only clean dirt and salt water in the cavern at decommissioning. As the nature of the waste is treated and disposed of, so too are any of our clients' liability concerns.

By taking advantage of the latest technologies, as well as the most stringent safety and environmental regulations, we can ensure the highest level of professional service.

This combination of technology, safety and environmental policy has made Plains Environmental one of the foremost leaders in waste disposal. And as our facility eventually recycles some of this waste, you can see why we are not only the safer way to dispose of your waste, but also the smarter way.

## Wastes Accepted:

### **Upstream wastes**

- Liquids, sludge and contaminated solids
- Drilling cuttings, fluids and wastes

### **Midstream wastes**

- Transmission and storage operation wastes

### **Downstream Wastes**

- Post-refined wastes and by-products
- Processed hydrocarbon wastes and spills

### **Industrial wastes**

- Glycols, hydraulic fluids, lubricants
- Ethanol, bio-fuels and mineral oils
- Compressor oils, metal contaminated oils

### **Hazardous and Non-Hazardous goods**

### **NORM materials**

- Naturally occurring radioactive materials
- Free on site screening available

**\* And others, please call for details**

# Plains Environmental

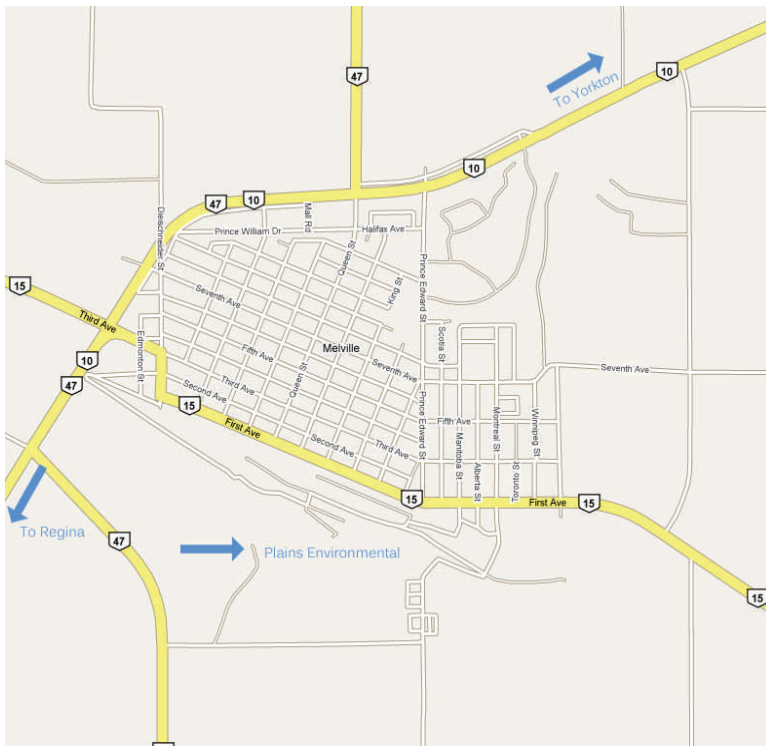

## Some of the top reasons to choose Plains Environmental

### Superior Cavern Integrity

Our underground facility was constructed from high pressure gas storage caverns. These caverns are impermeable to the point where we could fill them up with high pressure gas to 3000 psi. This translates into the perfect environment to eliminate your liability through the treatment, and the eventual oil recovery, in a secure contained environment.

### New and Innovative facilities

Having equipment like wash towers, containment skids, fire hose cleanouts and steam may not seem like a big concern, but it eliminates problems like frozen up trucks, long unloading times and the hang-ups which can extend the length of your job. We have a proven unloading time that ensures your time is being put to good use.

### 24 hr delivery

Being able to accept deliveries 24hrs a day puts us in a position to look after your needs as they require attention, letting you worry about other important issues.

### Various collection and disposal options

We are very flexible in methods of receiving this waste and can accept shipment via end-dump, liquid and vac-truck, railcar, flat deck with chemical totes or drums and barrels. Please note however, that there may be a handling fee for totes, drums or barrels as they are labour intensive to unload, clean, and dispose of if desired.

### Excellence in Environmental Policies

Enclosed caverns prevent environmental contamination of solid, liquid or airborne forms. Add to this the ground water testing and environmental audits which we conduct at our facility, and you will see that choosing Plains Environmental is a choice that you will be able to sleep easy with.

### Simplified pricing

Our simplified pricing structure of \$100/tonne for bulk solid or liquid waste disposal (non-NORM materials), eliminates the guesswork out of your disposal costs. You will know in advance what your exact costs will be and there will not be any extra hidden charges based on density or soil content.

Not only does this make good moral sense, but it makes good business sense as legacy cleanups of contaminated sites have consistently fallen on producers in recent years.
